

AI Usage DISCLOSURE FORM

1. Team Details

Team Name: CodeStorm

Project / Product Name: Interruptible Real-Time Agents

Organization / Institution (if any): SRM Institute of Science and Technology, Kattankulathur

Submission Date: September 30, 2026

2. AI Usage Declaration

Did your team use any Artificial Intelligence (AI) in developing this project? ☒ Yes ☐ No

Details: Claude Code (Anthropic) was utilized as an interactive AI coding assistant for architecture evaluation, implementation assistance, UI restyling, benchmark telemetry diagnostics, and test suite generation.

3. Purpose of AI Usage (Brief Details)

Idea generation / brainstorming: Evaluated architectural patterns for interruptible voice agents; evaluated speculative retrieval vs commit gate and determined speculative execution was unsafe for the scoring harness.

Code generation or assistance: Assisted in authoring and refining commit gate logic, debouncing buffer, idempotency checks, room token generation, and LiveKit event bindings.

UI / UX design: Redesigned the extension dashboard UI into a modern, card-based light theme with responsive pipeline cards based on reference design specifications.

Content creation: Generated and structured technical documentation, benchmark logs summary, and run configuration metadata.

Data analysis: Analyzed agent execution logs and benchmark outputs to isolate race conditions, unhandled exceptions, and speech recognition behavior.

Testing / debugging: Diagnosed asynchronous future hangs, connection lifecycle bugs, and unhandled mic permissions; generated comprehensive unit tests for commit gate policies.

Other: Submission checklist and compliance audit against Theme 5 participant guidelines.

4. Feature Origin Classification (Please add/delete based on the number of the feature)

1. Feature Name: Commit Gate & Debounce Interception Buffer (agent/commit_gate.py)

Self-Generated/AI-Generated/Both: BOTH (SELF & AI)

Description:

AI Tools / Platform Used: Claude Code (Anthropic)

Prompt Used: "Implement an asynchronous commit gate for LiveKit tool calls that holds proposed calls in a debounce buffer window to absorb mid-utterance user self-corrections, deduplicating identical calls and supporting explicit confirmation gates."

Output Summary: Python implementation of CommitGate managing buffered calls, cancellation of superseded calls, event telemetry, idempotency guards, and execution dispatch.

Modification: Identified and fixed an unhandled future exception leak where a failed tool execution left superseded waiters permanently hanging; integrated opt-in call timeouts and max call ceilings.

2. Feature Name: Block-Only Transcript Argument Resolver (agent/resolver.py)

Self-Generated/AI-Generated/Both: BOTH (SELF & AI)

Description:

AI Tools / Platform Used: Claude Code (Anthropic)

Prompt Used: "Create a conservative resolver that analyzes turn transcripts for speech disfluency corrections and only updates tool arguments when the user explicitly corrects a value, preventing hallucinated argument substitutions."

Output Summary: A targeted parser extracting explicit corrections (e.g., 'no, make that X') to override pre-emptive tool call arguments without modifying unmentioned fields.

Modification: Scoped strictly to single-utterance self-corrections to protect benchmark stability and prevent unintended state drift across turns.

3. Feature Name: Real-Time Audio / Video Snapshot Extension Pipeline
(extension/device_agent.py, extension/web_client.py)

Self-Generated/AI-Generated/Both: BOTH (SELF & AI)

Description:

AI Tools / Platform Used: Claude Code (Anthropic)

Prompt Used: "Implement single-snapshot camera transmission over LiveKit byte streams alongside native voice streaming, adding robust mic permission error handling and per-session dynamic room naming."

Output Summary: Client-side image capture downscaled to 768px sent via 'snapshot' byte stream into the chat context as ImageContent; unique room name generation per join to ensure clean worker dispatch.

Modification: Reverted unsupported 'en-IN' language code back to 'en-US' following live API validation failure; converted synchronous byte stream handlers to asynchronous tasks.

4. Feature Name: Interactive Live Dashboard & Benchmark Explorer
(extension/dashboard.html, scripts/build_dashboard_data.py)

Self-Generated/AI-Generated/Both: BOTH (SELF & AI)

Description:

AI Tools / Platform Used: Claude Code (Anthropic)

Prompt Used: "Build an evaluation dashboard and scenario explorer reading live data from benchmark evaluation JSON files, and style dashboard.html with a clean, light, card-based interface."

Output Summary: HTML/CSS/JS dashboard rendering live agent pipeline stages, commit gate decision feeds, benchmark comparisons (Ours vs Baseline across 100 recordings), and a data aggregator script.

Modification: Corrected path resolution in build_dashboard_data.py for portable repository cloning, and preserved all underlying JS event listeners during CSS overhaul.

5. Feature Name: Harness Hardening & Sensitive Argument Redaction (agent/commit_gate.py)

Self-Generated/AI-Generated/Both: BOTH (SELF & AI)

Description:

AI Tools / Platform Used: Claude Code (Anthropic)

Prompt Used: "Add argument redaction for sensitive fields in telemetry events, optional tool execution timeouts, and execution budget limits to prevent runaway loops."

Output Summary: Pattern-matching redaction masking sensitive fields (passwords, tokens, pins, card numbers) from event logs, async timeout wrapper, and 7 unit tests.

Modification: Strictly kept redaction within logging and telemetry layers so actual tool execution receives unmodified arguments; rejected speculative tool execution to avoid scoring penalties.

5. Ethical & Compliance Confirmation

AI usage complies with guidelines and policies: Yes

No proprietary or copyrighted data misused: I Agree

6. Declaration & Sign-Off

Name of Team Representative: Gunak

Role: Team Lead / Developer

Signature: Gunak

Date: September 30, 2026
